

LIGHT COMMUNICATIONS TERMINAL

The Light Communications Terminal (LCT) is an HF data and voice communications system. The product is in service with the Canadian Army in a 400W HF/ALE configuration using modern computer-based message processing and control and encryption equipment.

The HF system is installed in a militarized air conditioned shelter and is suited for mounting in a small vehicle such as the Canadian Army Light Support Vehicle (1¼ Ton Vehicle).

The equipment is ruggedized and shock mounted, and the shelter meets standard military EMI/EMC specifications. Remote operation and control of the equipment over secure links, using either fibre optic links or field telephone wire, is also provided.

The LCTs provide transportable HF tactical secure voice and data communications and are interoperable within the NATO Alliance countries. Other configurations are also available.
